

Convert PDF to Image(s) using ImageMagick

Posted on: June 14, 2015 by Aleksandar Jakovljević (<https://plus.google.com/u/0/109644476289291709300?rel=author>) in Linux (<https://aleksandarjakovljevic.com/category/linux/>), Web development (<https://aleksandarjakovljevic.com/category/web-development/>)

There is a quick and convenient way to convert PDF to one or more images. Command line tool ImageMagick (<http://www.imagemagick.org/>) does that (and a lot more). You can convert an entire PDF document to a single image, or, if you like, there is an option to output pages as a series of enumerated image files.

Note: It is advisable to use **density**, **antialias** and **quality** options to get the conversion quality that suits your needs. In following examples we are going to use -density 150, -quality 100 and -antialias options. **ImageMagick** is intuitive and it will guess the output format based on output filename extension.

Examples:

Convert an entire PDF to a single image:

```
convert -density 150 -antialias "input_file_name.pdf" -append -resize 1024x -quality 100 "output_file_name.png"
```

Key parameter here is -append which actually makes a difference if PDF is converted to a single image or to a series of images.

Convert a PDF document to a series of enumerated images:

```
convert -density 150 -antialias "input_file_name.pdf" -resize 1024x -quality 100 "output_file_name.png"
```

As a result of this command a series of image files named output_file_name-0.png, output_file_name-1.png, output_file_name-2.png etc, will be created in the working directory. If you have more than 10 pages, it would come in handy to have those enumerated file names with multiple digits, for the convenience of easy sorting. If you include a C-style integer format string, for example if you add %03d to the end of your output file name, you will get output_file_name-001.png, output_file_name-002.png, output_file_name-003.png, etc.

```
convert -density 150 -antialias "input_file_name.pdf" -resize 1024x -quality 100 "output_file_name-%03d.png"
```

Convert only specified pages to images:

```
convert "input_file_name.pdf[1]" "output_file_name.png"
```

This will actually convert page 2 of PDF to PNG, since numbering starts with 0. To convert range of pages, from use this command:

- August 2016 (<https://aleksandarjakovljevic.com/2016/08/>)
- June 2016 (<https://aleksandarjakovljevic.com/2016/06/>)
- February 2016 (<https://aleksandarjakovljevic.com/2016/02/>)

Archive

- June 2019 (<https://aleksandarjakovljevic.com/2019/06/>)
- December 2017 (<https://aleksandarjakovljevic.com/2017/12/>)
- December 2016 (<https://aleksandarjakovljevic.com/2016/12/>)

```
convert "input_file_name.pdf[i-j]" "output_file_name.png"
```

Using with PHP

Since this is a command line utility, you can access it from PHP using some of the functions to execute external commands. For example, `exec` (<http://php.net/manual/en/function.exec.php>), `system`, `passthru` (<http://php.net/manual/en/function.passthru.php>), etc.
